ISE OVERVIEW

The Cisco Identity Services Engine (ISE) is a platform that combines authentication, authorization, posture, profiling and guest management services in a single unified appliance. It has a single management console for configuring and administering services, enabling consistent and simplified administration.

The system permits the enforcement of a number of different policies depending on device type, user and role. Endpoints that are out of compliance can be directed to remediation servers for the delivery of patches and other updates.

DELIVERY OVERVIEW

The SecurView delivery platform, CASPER, integrates with ISE providing a mechanism for performing administrative tasks with multi tenant facility. CASPER also performs security data collection, normalization and categorization of collected data. CASPER analyses the collected data providing visibility to customers on various performance metrics of critical events, also helping to manage security across the enterprise and meet various regulatory/compliance needs. Security Operation Center personnel monitor and manage ISE remotely using CASPER.

CUSTOMER BENEFITS

- Protect the network from unauthorized access
- Enforce group policies to control user network access
- Policy based reports
- Enhance security posture
- Policy-based compliance reports
- User-friendly GUI portal
- 24x7x365 monitoring
- Certified Security Analyst support
- Efficient incident handling
- Cost-effective delivery model
- Extension of customer's helpdesk
- Flexible service hours
- Sustenance of ISE infrastructure
